### Hadassah's collaboration with Deep Health

Deep Health aims to solve an unmet need in orthopedic surgery for real time navigation with increased accuracy and reduced exposure to fluoroscopy. For this reason, when approached by the company in 2018, Hadasit, in consultation with clinical experts at Hadassah, was interested in establishing a collaboration.

Through Hadasit, Hadassah is cooperating with the company with respect to data sharing, access to facilities, consultation and serving as a primary site for experimentations.

The company applied to the first course of Hadassah Accelerator, a program powered and operated by IBM Alpha Zone, at Hadassah Ein Kerem campus. Over forty companies applied and were screened by a team of hospital experts and management, IBM Israel experts and additional program partners (legal, financial, etc...).

Deep Health impressed the team with its intent to provide an accurate real time navigation solution, with reduced radiation and affordable cost, and was one of the five companies accepted to the program, which started operations recently.

We, at Hadasit, hope this program will further assist the company in advancing its' R&D efforts and strengthen its' ties with Hadassah.
